GREAT 5000

GREAT TEKNOLOJİ

A device that works with 5 professional search systems

Systems:

3D ground scanning

The 3D ground scanning system in the GRT device uses the latest technologies to send and receive signals in the direction of the device and uses a 3D analyzer capable of drawing a 3D map of potential objects in the ground.

Discrimination

This system determines whether a burial is valuable or worthless by sending and receiving pulses through the device's sensor and analyzing the received pulses.

Vertical scanning

This device is equipped with a vertical scanning system. This system, familiar to many treasure hunters, provides the user with the ability to directly view changes in the frequencies scanned by the device along with the color gradation at any time.

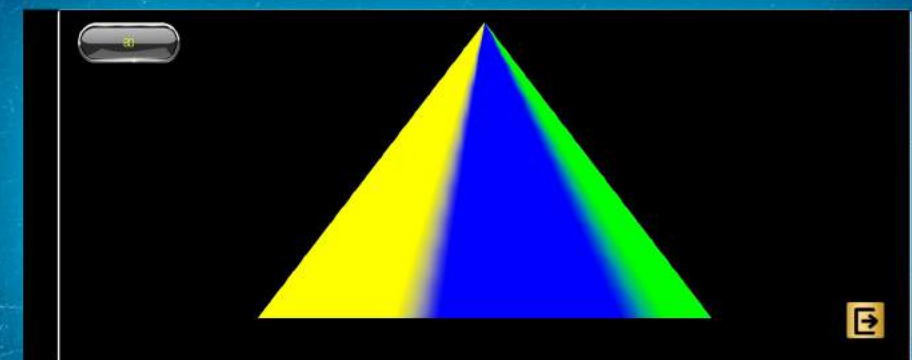

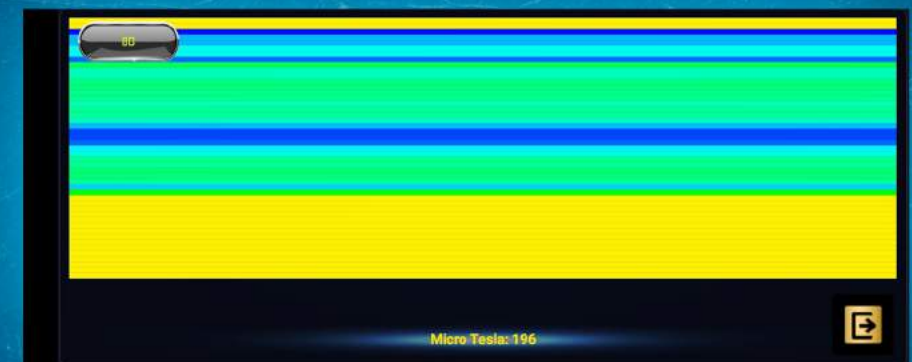

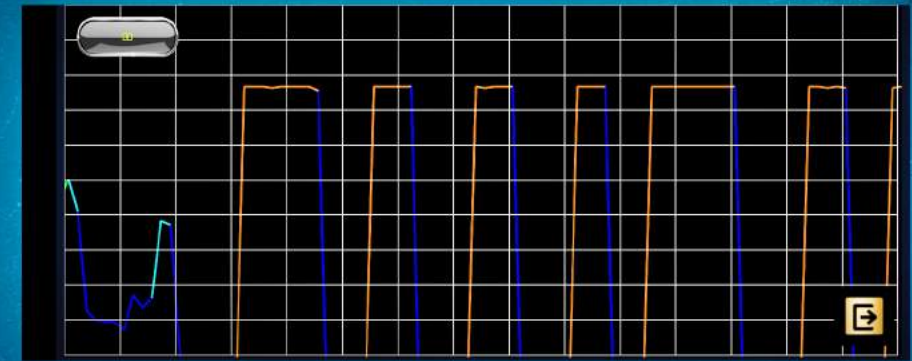

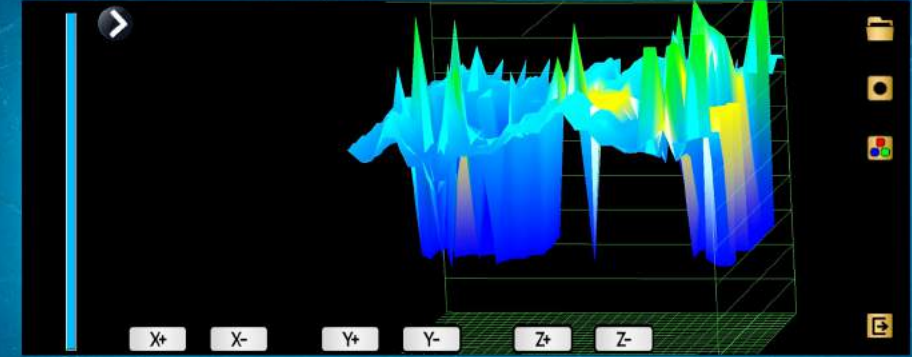

Horizontal scanning

A system called live streaming is designed to provide this process as a horizontal scan for treasure hunters. Using this system, the search can be performed at any angle the user needs.

Sound system

This system displays the frequencies received from the device's sensor as a number on the screen and emits a sound. Below you can see the received frequencies and their targets.
